

# Alcohol and Medication Interactions

Medicines can treat and cure many health problems. However, they should be taken properly to make sure that they are safe and effective for you.

Certain foods, beverages, alcohol, caffeine, and even cigarettes can interact with medicines. This may make them less effective or may cause dangerous side effects or other problems (such as falls and confusion). Sometimes people end in the hospital because of these problems, particularly for alcohol-medication interactions.

## Guidelines for Seniors

Reduce your risk of developing a medication-alcohol interaction problem:

1. Make sure your doctor and pharmacist know about every drug you are taking, including non-prescription drugs, over the counter drugs, and any supplements such as vitamins, minerals and herbal drugs. Be honest.
2. Let them know if you smoke or you drink alcohol, even if it is only occasionally. "Alcohol" includes all hard liquor (e.g. brandy, gin, whiskey), wine or sherry, and beer.
3. If you drink alcohol, ask your doctor or pharmacist to explain to you in down to earth language about how alcohol interacts with the particular drugs you are taking.

Ask how your other drugs and supplements affect each other. Many drugs interact with other drugs. Some may cause serious medical conditions.

4. Carefully follow the instructions on your medications.
5. If you have problems or experience side effects related to your medication, call your health care provider right away.
